

OpenSTLinux BSP device tree files

with STM32CubeMX
for an easier HW configuration

Time 10 min

Very powerful configuration and code generation

Support all STM32 MCU and MPU, with integrated powerful Finder

New fresh and modern UI

Device tree for Linux, U-Boot & TF-A

3

- STM32 peripheral drivers configuration by device tree
- Linux developers manually edit device tree source files, **STM32CubeMX** enables this **generation from** to ease new comers hands-on!

Generated
Device Tree

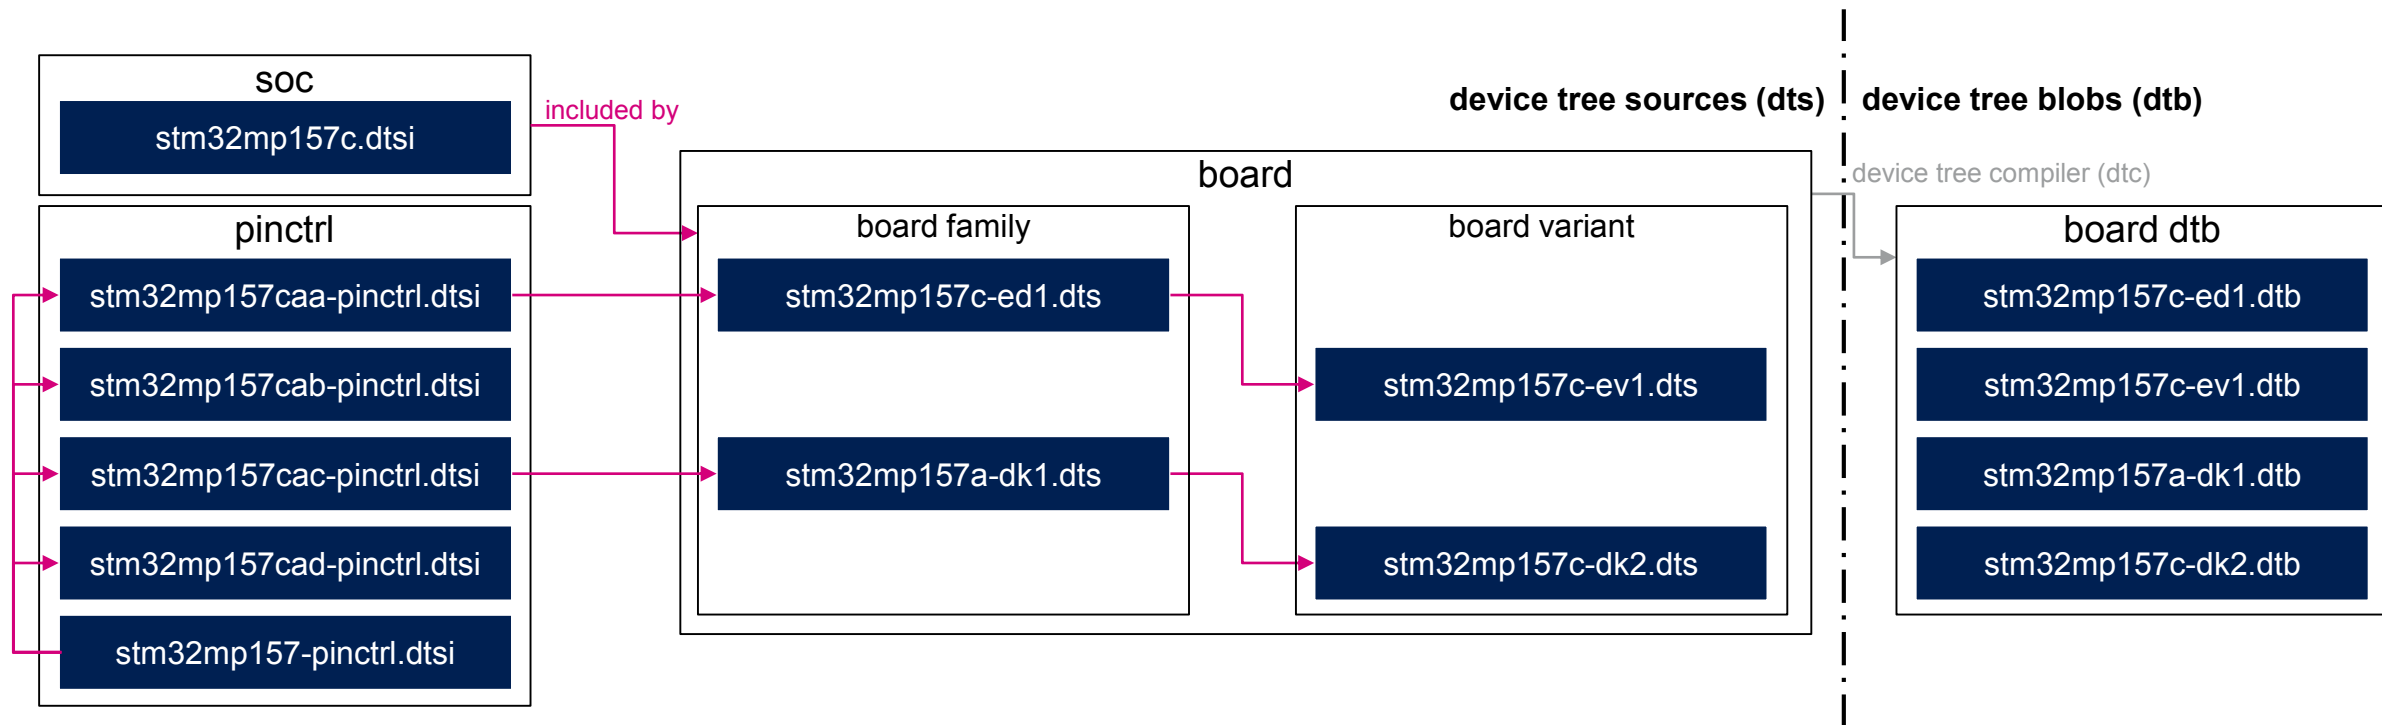

- 3 device tree files (DT) :
 - **TF-A (first stage boot loader)** : DDR configuration, RCC clock tree, Peripheral assignment
 - **U-Boot (second stage boot loader)** : specifics peripherals (Ethernet, USB boot devices)
 - Linux DT : peripheral used by applications at run time

Upstreamed device tree

Linux

Legend

- ed: evaluation daughter board (embedding the STM32MP1)
- ev: evaluation board (ed plugged on the mother board)
- dk: discovery kit

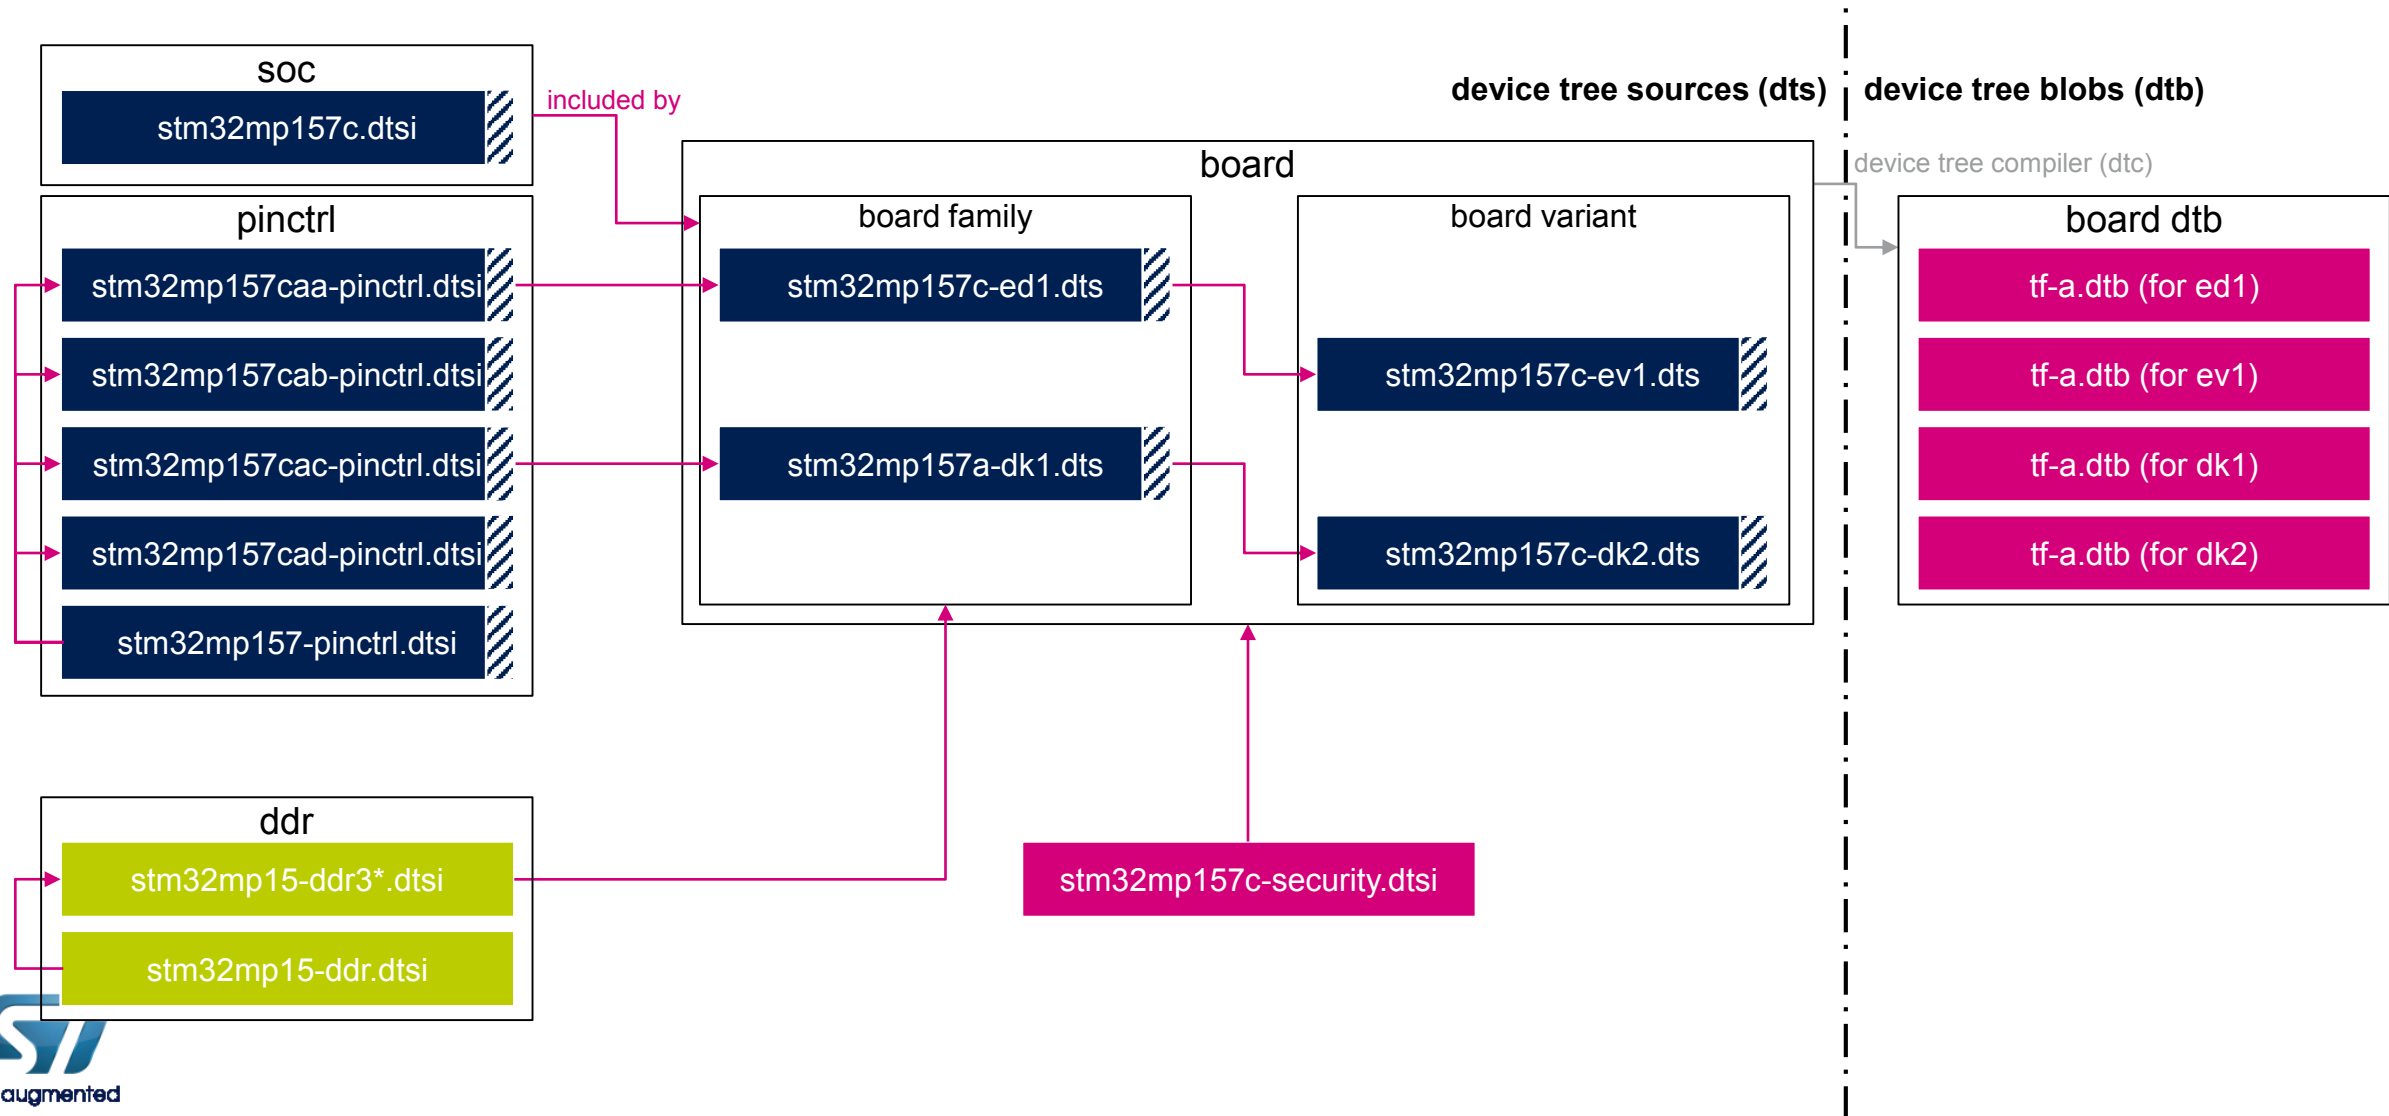

Upstreamed device tree

TF-A, overloading subsets of Linux files copies and using DDR config from U-Boot

Legend

- ed: evaluation daughter board (embedding the STM32MP1)
- ev: evaluation board (ed plugged on the mother board)
- dk: discovery kit

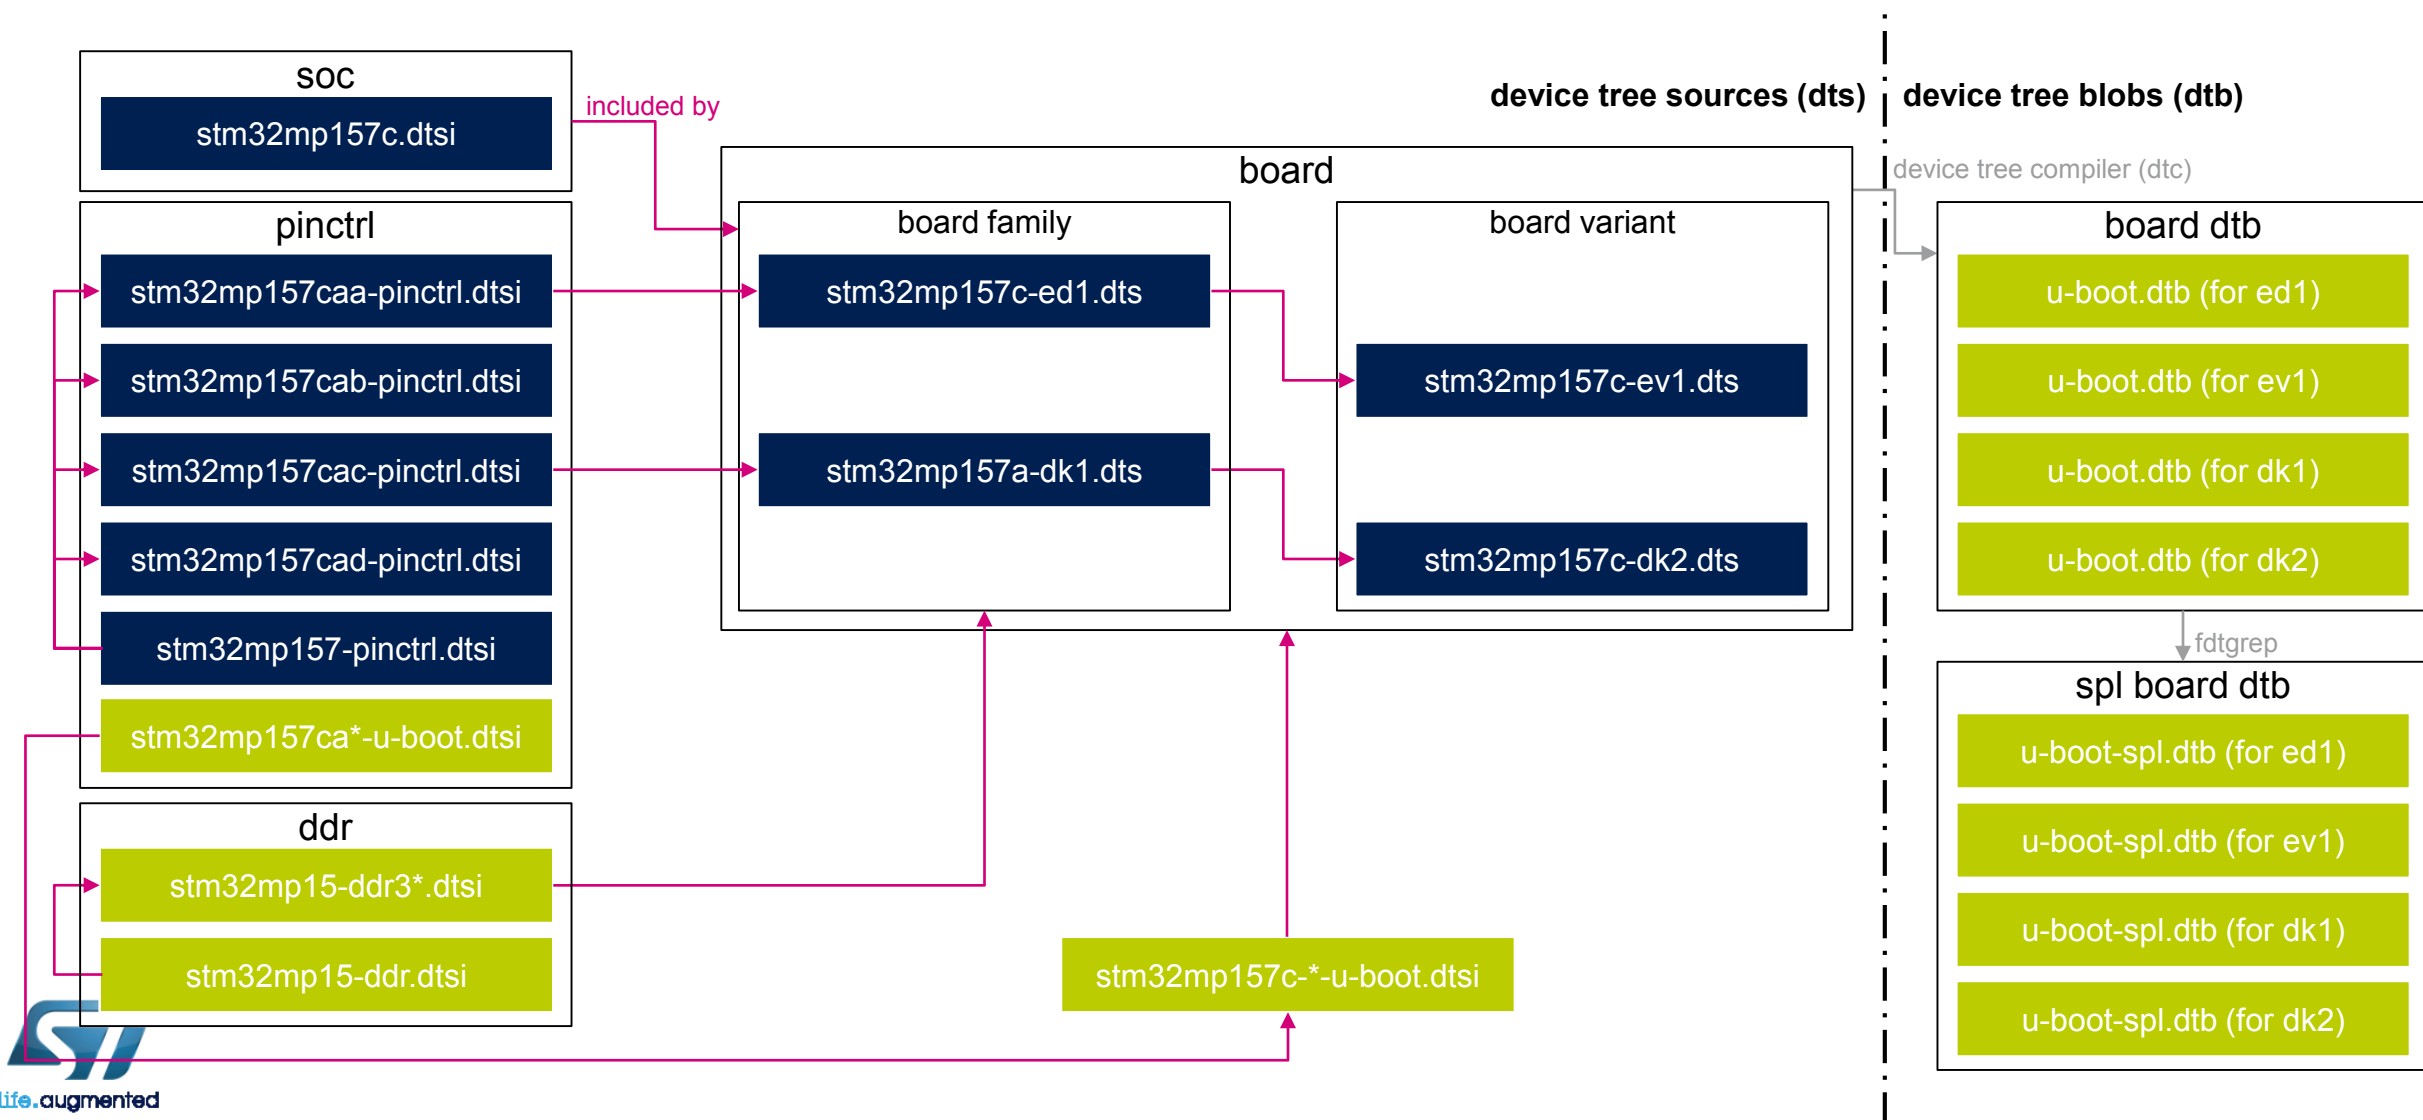

Upstreamed device tree

U-Boot, overloading copies of Linux files

Legend

- ed: evaluation daughter board (embedding the STM32MP1)
- ev: evaluation board (ed plugged on the mother board)
- dk: discovery kit

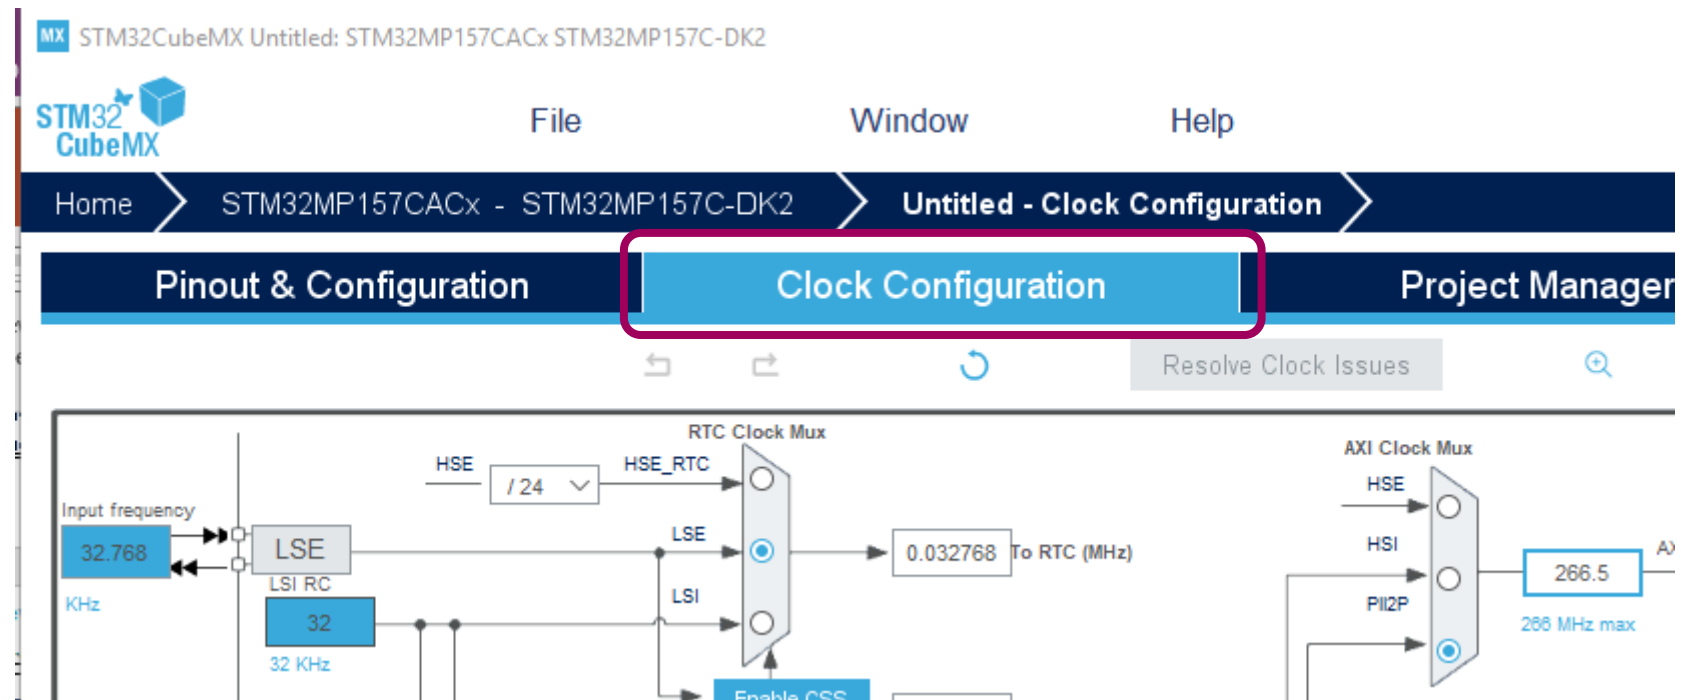

Device tree Clock Tree Setup

7

STM32CubeMX automatic generation

- Clock tree initialization is done at boot time by TF-A fw
- The Clock configuration is contained in the TF-A device tree file
- STM32CubeMX tab allow graphical clock tree configuration

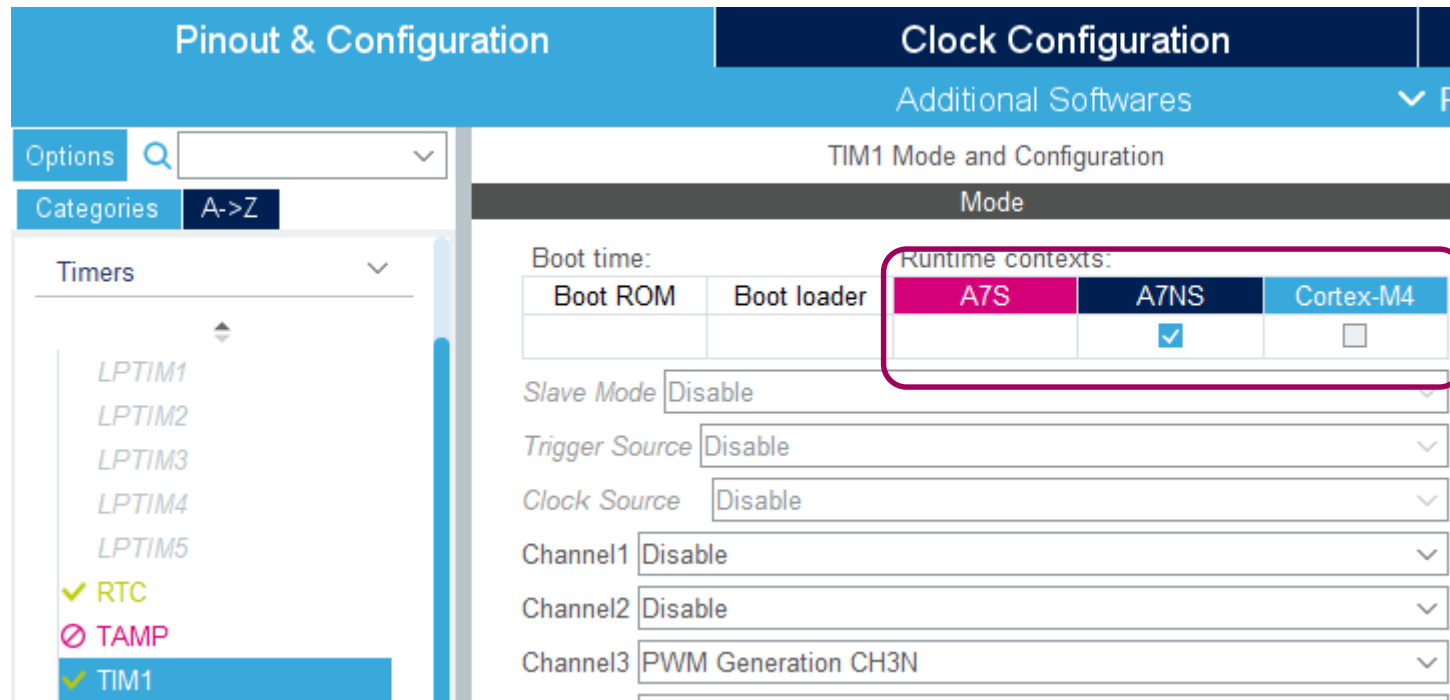

Device tree Peripheral Security Setup

9

MCU Peripheral hw isolation & A7 trusted context

- Peripheral assignment to hw context is done at boot time by TF-A fw
- Located in the TF-A device tree file
- STM32CubeMX Peripheral

STM32cubeMx project with
device tree generated file
